# Stanley Theme

## Summary

To show that you have a good grasp of HTML and CSS, it is now time to create a Liferay theme. Following the documentation provided by Liferay, create the Stanley theme.

## Objective

Create a new theme based on the given design.

## Requirements

### Assumptions

- Initial set of content has been created (they are available via a LAR file for the AMF site which is provided).

### General Specifications

- Header should span across the entire width of the browser window.
- Theme parent should be `_styled`
- Header and footer both have navigation bars with different designs.
- The sign-in link should look like a button per the design screenshot.

### Technical Specifications

- Breadcrumb should be removed from theme (not simply hidden via CSS).
- To keep our site performance at the highest level, custom CSS should be kept to 300 lines or less.
- Do **not** use `!important` with your CSS selectors.
- Remove portlet borders via the look and feel xml file.
- Use Sass and Compass for CSS3 effects.
- Create a responsive navigation.
- Follow the Liferay best practices for [CSS] 1 and [JS] 2.

### Design

[Home (Desktop) ([full size] 9)](#)

[Home (Mobile) ([full size] 10)](#)

[Work (Desktop) ([full size] 11)](#)

[Work (Mobile) ([full size] 12)](#)

## Resources

The assets seen in the screenshots can be imported using the following [LAR file] 13. Theme development is covered in our public training. You can find the material on liferay.com/group/training. A quick start guide can also be found here.
